EDUCATION

Georgia Institute of Technology - Bachelors of Science, Computer Science, **GPA 3.87 / 4.0** **May 2028**

- **Concentration** - Systems & Architecture + Intelligence; **Honors** - Presidential Scholar, Dean's List, Zell Miller Scholar

Relevant Courses - Data Structures, Algorithms, Database Mgmt., Software Development, Linear Algebra, Discrete Math

EXPERIENCE

NCR Atleos, Software Engineer Intern (Data & AI Team); Atlanta, GA **May 2026 - August 2026**

- Built a Graph RAG natural language Q&A layer on Microsoft Fabric using LangChain and Cypher-generating LLM pipelines, reducing agent response times by **~70%** while increasing answer accuracy and capability by **~50%**
- Developed an AI-powered semantic layer recommendation engine using Azure OpenAI and agentic workflows to profile raw SQL tables and auto-generate Power BI-ready schemas, reducing scaffolding time by **~60%**
- Architected a Neo4j-backed data layer integrating 5+ cross-domain internal data sources (**10M+** node relationships) into a unified backend, enabling connected querying and reducing multi-hop retrieval latency by **~40%**

Convention Connection, Software Engineer Intern; Atlanta, GA **December 2025 - July 2026**

- Engineered an AI-powered image processing pipeline using OpenCV and FastAPI to automate card photo cropping, reducing manual processing time by **75%** and managing **1,000+** images via Google Photos API on GCP
- Architected pricing engine and auction monitor in Python with **90** rules and real-time bid tracking across marketplaces
- Built a domain-aware trade matching engine with a weighted scoring algorithm across grade, set, and grading company

AlgoVerse AI, AI Researcher; Remote **September 2025 - March 2026**

- Developed a novel multi-task benchmark evaluating LLMs' vision-based tool use capabilities in geolocation reasoning tasks, architected evaluation frameworks that test spatial reasoning; submitted to **COLM 2026**
- Automated 300+ location data collection via Python/Selenium and Street View API with programmatic validation
- Refactored prototype codebase into a production-ready repository with CI/CD integration, implemented **50+** automated tests and type checks that reduced setup time by **20%** and enabled reproducible one-command execution

PROJECTS

Polymarket HFT Bot - Low Latency Systems **April 2026**

- Engineered a high-frequency trading framework in C++ and Python targeting Polymarket BTC 15-minute prediction markets, integrating Polymarket CLOB API and Goldsky for real-time on-chain market data ingestion
- Implemented cross-venue arbitrage detection across Polymarket, Kalshi, and Binance using a Log-Normal probability model with a PPO reinforcement learning agent and LSTM actor-critic network built in PyTorch
- Bridged C++20 execution engine with Python ML inference via pybind11 for **sub-millisecond** order routing

Switch - Multi-AI Model Platform **February 2026**

- Shipped a full-stack multi-model AI platform serving **100+** users and **14K+** daily backend requests across LLMs
- Built and fine-tuned a custom prompt-routing classifier splitting traffic **70/30** between economy and premium models; unified disparate provider APIs behind middleware for consistent streaming across all 4 models
- Engineered Cortex, a persistent memory system on Supabase Postgres with pgvector embeddings, enabling low-latency semantic retrieval of user context and conversation history across **10K+** daily database queries

TECHNICAL SKILLS

Languages | Python, Java, C++, TypeScript, JavaScript, SQL, Bash

AI Tools | Azure OpenAI, LangChain, LangGraph, Agno Agent, Claude Code, pgvector, MCP, AntigraVity, GitHub Copilot

Frameworks | React, Next.js, FastAPI, Spring Boot, Node.js, D3.js

Tools & Libraries | Git, Docker, CI/CD, AWS, Vercel, Neo4j, PostgreSQL, Redis, OpenCV, PyTorch, pybind11, SQLAlchemy
